Sprint 1 - objective

Deliver a complete inventory management and analysis solution: cleaned and modeled **ERP ALVO** data, a traceable **GitHub** repository and an intuitive **dashboard** that supports reliable decision-making.

Inventory turnover

Average storage time

ABC classification

Historical
movements

Data foundation

01

Clean the ERP ALVO data

Ensure consistency and
reliability for every analysis.

02

Structure the GitHub repository

Ensure traceability and
versioning of all artifacts.

03

Model the movement history

As a data analyst, build the
base for time-based analysis
of inflows and outflows.

Dashboard

04

Key indicators

Total item quantity, total immobilized value and average stock.

05

Managerial filters

Filter by warehouse, period, material type and cost center.

06

Temporal evolution

Track stock evolution and the history of inflows and outflows.

07

Intuitive interface

Accessible navigation with the fewest clicks possible.

Inventory analytics

08

Inventory turnover

Turnover by material, showing high and low rotation.

09

Average storage time

Average time that materials stay in storage.

10

ABC curve

Automated ABC classification by criticality and budget impact.
